Training a Regression Model on Azure Platform

Objective:

Train a regression model using a dataset (random or manual dataset created by Maria) on the Azure Machine Learning platform to predict target values based on input features without doing any coding.

Create DataSet in Excel and Import as CSV File:

	A	B	C	D
1	Serial No.s	Names	Age	Salary
2	1	Ali	25	3928
3	2	Khan	44	1546
4	3	Sara	40	2397
5	4	Nick	48	1579
6	5	Johns	43	2323
7	6	Sana	39	3374
8	7	Aisha	24	1198
9	8	Taylor	21	4339
10	9	Jira	31	2029

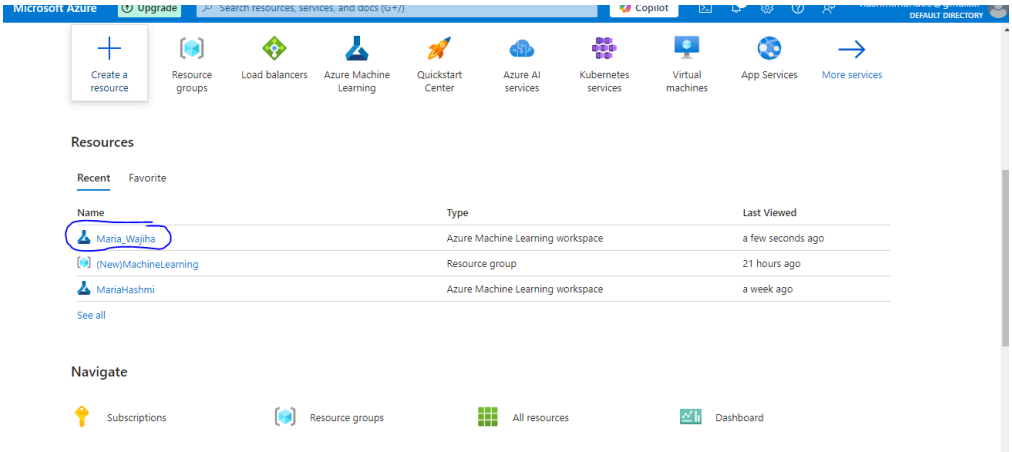
.....

A42 fx 41

	A	B	C	D
42	41	Jira	43	3006
43	42	Richa	15	1342
44	43	Roomi	31	2524
45	44	Ash	39	4599
46	45	Rock	33	3965
47	46	Max	50	3357
48	47	Tony	36	2813
49	48	Robin	49	2914
50	49	Ali	55	1809
51	50	khan	60	4647

Step 1: Create an Azure Machine Learning Workspace

- Sign in to Azure portal and create a new resource.
- Search for Machine Learning via search bar and select Create.
- Fill in the required details like subscription, resource group, and workspace name, then Create the workspace (step by step).



Step 2: Prepare the Dataset

- Prepare the dataset in CSV file.
- Upload the file of dataset to the Azure Blob Storage after that follow NEXT step to proceed.
- Click on Datasets under the Assets tab, then Create Dataset and fill blank fields according to suitable name related to your work to understand easily.
- Then choose From local files.
- Define the dataset properties like name, description, and data type. Verify and register the dataset.

Tabular

Use cases for data types

When should I use File type?

The File type is recommended in most scenarios when you are working with a single data file of any type (including tabular data). This type allows you to specify a file location by URI in a storage location on your local computer, an attached Datastore, blob/ADLS storage, or a publicly available http(s) location. There are many types of supported URIs. In the Azure Machine Learning CLI v2 or Python SDK v2, this data type is called uri_file. Learn more about the uri_file type

When should I use Folder type?

The Folder type has all the same capabilities and use cases as the File type, but is used when specifying a

Choose a source for your data asset
Choose the data source you want to create your asset from. A data source can be from a local storage location on your computer, from an attached datastore, from Azure storage, or from a publicly available web location.
From Azure storage
Create a data asset from registered data storage services including Azure Blob Storage, Azure file share, and Azure Data Lake.
From local files
Create a data asset by uploading files from your local drive.
From SQL databases
Create a dataset from Azure SQL database and Azure PostGreSQL database.
From web files
Create a data asset from a single file located at a public web URL.
From Azure Open Datasets

Titanic Dataset - Sheet1.csv
884 bytes/884 bytes
What file types can I use?
Supported file types include: delimited (such as
or tsv), Parquet, JSON Lines, and plain text.
Where are files uploaded?
Files will be uploaded to the selected datastore
made available in your workspace.

Step 3: Create an Experiment

- In the Azure Machine Learning Studio, navigate to the Experiments section or portion.
- Click Create new and provide a name for the experiment. (we can assign any name to understand easily that, which model we applied)
- This experiment will serve as the container for tracking your model training and performance metrics.
- After completion your task you can can your check your summary between the matrices parameters.

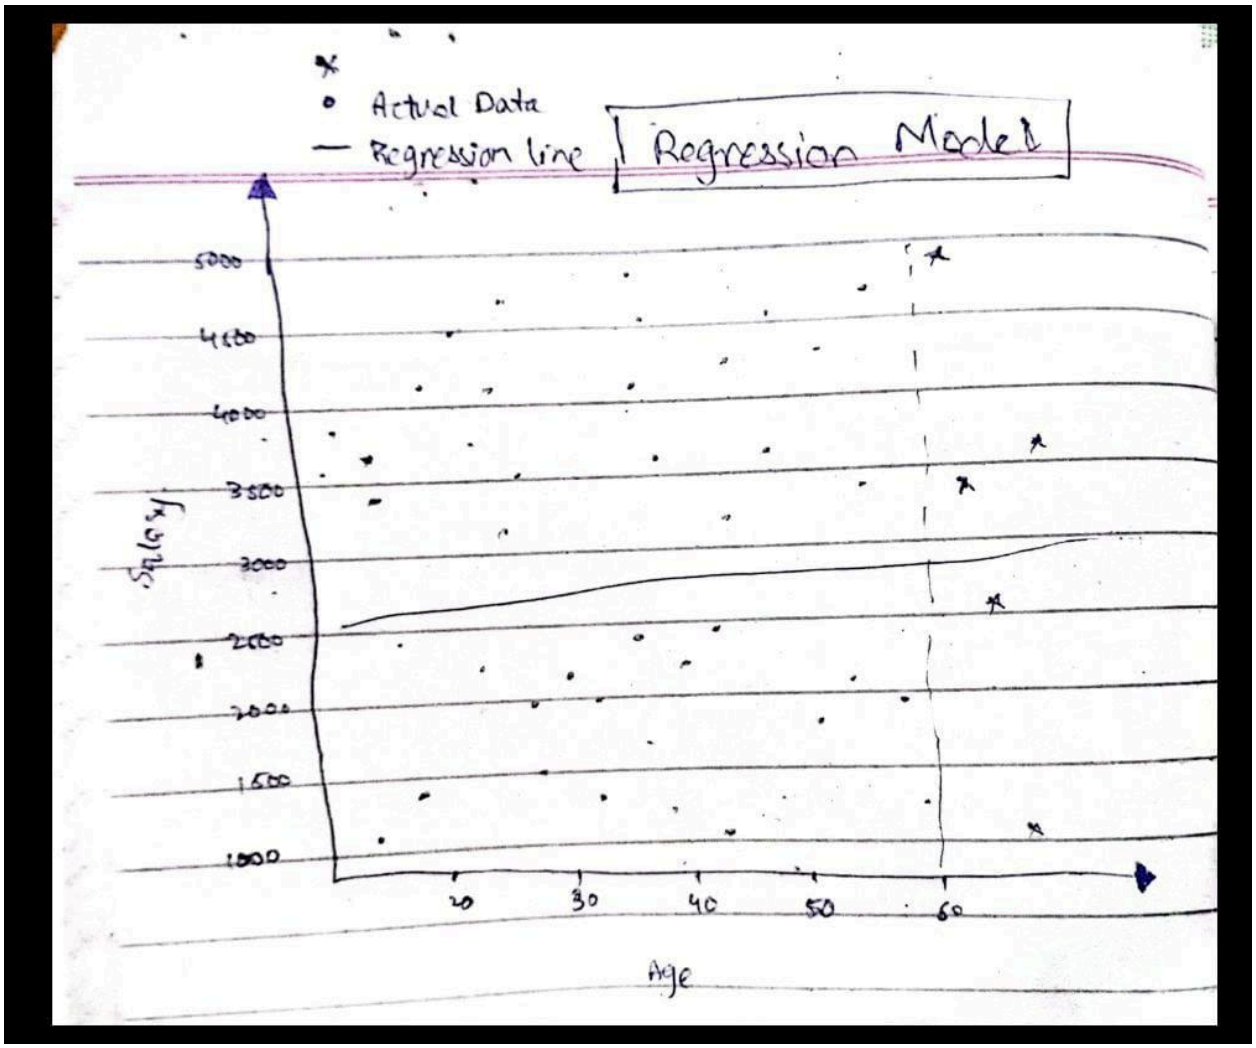
Step 4: Plotting Graph

Here is the regression model graph showing the relationship between age and salary (just integer values) from the dataset. The blue points represent the actual data from my dataset, while the red line represents the linear regression line (applied).



Step 5: Conclusion

Using Azure's integrated environment, we can efficiently build and train a regression model. This process facilitates seamless scalability, real-time monitoring, and integration capabilities for predictive analytics without doing any coding.
